

PayFlow Control

Product Validation & UAT Report

Product	: PayFlow Control – Payment Operations Intelligence SaaS
Document	: Product Validation & UAT Report
Product Stage	: MVP Validation
Role	: Product Manager / Product Development
Project Type	: Independent Product Development Portfolio Project
Validation Approach	: Functional Validation & User Acceptance Testing (UAT)

1. Purpose

This document records the product validation and User Acceptance Testing (UAT) performed on the PayFlow Control MVP.

The purpose of the validation was to confirm that the MVP:

- Implements the approved product scope.
- Supports the intended payment operations workflows.
- Provides functional navigation across core modules.
- Allows users to review and manage operational records.
- Reflects workflow status changes consistently across related views.
- Provides a coherent experience suitable for MVP demonstration and portfolio evaluation.

This validation focused on **product behavior and user workflows**, rather than production-scale performance, regulatory certification, or live payment processing.

2. Validation Scope

The validation covered the following core MVP areas:

Module	Validation Focus
Dashboard	KPI visibility, operational alerts, Recent Activity, navigation
Transactions	Transaction list, search/filter, transaction detail, navigation
Reconciliation	Record list, reconciliation detail, status workflow
Exceptions	Exception list, exception detail, review/status workflow
Risk Monitoring	Risk records, risk detail, status workflow
Compliance	Compliance records, review workflow, approval/rejection
Cross-module Navigation	Links between related records and modules
Workflow State	Status changes reflected consistently across the application

3. UAT Approach

Testing was performed through realistic user journeys representing the primary operational activities of a payment operations user.

The approach consisted of:

1. Opening the application from the Dashboard.
2. Navigating between operational modules.
3. Opening individual records.
4. Reviewing record details.
5. Performing available workflow actions.
6. Returning to the Dashboard or parent list.
7. Confirming that updated statuses and operational activities remained consistent.
8. Repeating navigation after page changes and browser refreshes where relevant.

The testing was performed against the locally running MVP environment.

4. UAT Scenarios

UAT-01 — Dashboard Navigation and Operational Overview

Objective:

Verify that the Dashboard provides a consistent overview of operational activity and remains stable when users navigate between modules.

Validation:

- Dashboard loads correctly.
- KPI cards are displayed.
- Recent Activity displays current operational records.
- Dashboard links navigate to the appropriate modules.
- Returning to the Dashboard does not restore obsolete merchant/demo data.
- Operational records use the current PayFlow Control sample data.

Result: PASS

A previous issue was identified where legacy “Hotel A–F” demo data reappeared after navigating away from and back to the Dashboard. The issue was corrected by updating the Dashboard data sources and activity definitions.

UAT-02 — Transaction Monitoring

Objective:

Verify that users can review payment transactions and access transaction details.

Validation:

- Transaction list displays the expected records.
- Transaction ID is clickable.
- Search functionality works.
- Status filtering works.
- Transaction status reflects workflow state.
- Transaction detail page displays transaction information.
- Navigation back to the transaction list works.

Result: PASS

The final MVP navigation uses the **Transaction ID as the primary entry point to transaction details**, avoiding unnecessary duplicate “View” actions.

UAT-03 — Exception Management

Objective:

Verify the exception review workflow.

Validation:

- Exception records are displayed.
- Exception details can be opened.
- Exception status is displayed.
- Available review actions can be performed.
- Resolved exceptions are removed from active Dashboard activity.
- Exception status is reflected consistently across related views.

Result: PASS

Exception list and detail workflows were validated successfully.

UAT-04 — Risk Monitoring

Objective:

Verify that risk records can be reviewed and their workflow status managed.

Validation:

- Risk records are displayed.
- Risk detail pages can be accessed.
- Risk severity is visible.
- Risk workflow status is displayed.
- Status changes are reflected in the Dashboard and risk views.

Result: PASS

Risk Monitoring functionality was validated as part of the MVP operational workflow.

UAT-05 — Compliance Review

Objective:

Verify the compliance review workflow.

Validation:

- Compliance records are displayed.
- Compliance details can be accessed.
- Review status is displayed.
- Pending review records can be identified.
- Approval and rejection actions are available where applicable.
- Completed reviews are reflected in the workflow state.

Result: PASS

A specific issue was identified during UAT involving **CMP004**, where the detail page did not initially expose the expected Approve/Reject actions. The workflow was subsequently corrected and revalidated.

UAT-06 — Reconciliation Management

Objective:

Verify the reconciliation workflow and its relationship with payment transactions.

Validation:

- Reconciliation records are displayed.
- Reconciliation records can be identified by their IDs.
- Reconciliation detail information is accessible.
- Reconciliation status is displayed.
- Matched/unmatched states are reflected in operational metrics.

Result: PASS

The reconciliation workflow was validated after resolving the initial issue where detail navigation was unavailable.

UAT-07 — Cross-Module Consistency

Objective:

Verify that the same operational records maintain consistent status and navigation across the application.

Validation:

- Transaction IDs are consistently referenced.
- Exception records link to the relevant transaction.
- Risk records reference relevant payment activity.
- Compliance records provide operational review context.
- Reconciliation records reference payment activity.
- Dashboard activity links to the appropriate operational record.
- Status changes are reflected in relevant views.

Result: PASS

The MVP demonstrated the intended relationship between the major payment operations workflows.

5. Defects Identified and Resolved

During UAT, several functional and data-consistency issues were identified.

Issue	Impact	Resolution	Status
Legacy “Hotel A–F” data appeared in Dashboard activity	Data inconsistency	Replaced legacy Dashboard activity data with current PayFlow Control records	Resolved
Dashboard activity returned after navigation	Inconsistent user experience	Corrected Dashboard data source/state handling	Resolved
CMP004 lacked expected review actions	Compliance workflow incomplete	Added/corrected Approve/Reject workflow	Resolved
Reconciliation detail was initially inaccessible	Detail workflow incomplete	Corrected record navigation	Resolved
Transaction action displayed unnecessary “View” button	Navigation redundancy	Transaction ID retained as primary detail link	Resolved
Transaction detail navigation styling was inconsistent	UI inconsistency	Standardized back-navigation presentation	Resolved

6. UAT Acceptance Criteria

The MVP was considered acceptable when the following conditions were met:

- Core operational modules are accessible.
- Core records can be reviewed.
- Detail pages are reachable.
- Primary workflow actions operate correctly.
- Status changes are reflected in the relevant views.
- Dashboard information reflects the current MVP data model.

- No legacy demonstration data appears in active operational views.
- Cross-module navigation works consistently.
- No critical blocker remains in the core MVP workflows.

Overall UAT Result: ACCEPTED FOR MVP DEMONSTRATION

7. Validation Limitations

The validation was performed against a portfolio MVP using simulated application data.

Therefore, this UAT does **not** constitute:

- Production acceptance testing.
- Payment-network certification.
- Security penetration testing.
- Regulatory compliance certification.
- Load or stress testing.
- Validation using live merchant transaction data.
- Validation of live payment gateway integrations.

The purpose of this validation is to demonstrate that the defined product concept and MVP workflows are **functionally coherent and demonstrable**.

8. Product Validation Outcome

The validation confirmed that the PayFlow Control MVP provides a coherent operational workflow across:

Transactions → Exceptions → Reconciliation → Risk Monitoring → Compliance → Dashboard

The MVP successfully demonstrates the intended product concept of a **Payment Operations Intelligence SaaS** that provides visibility into payment activity and supports operational investigation, reconciliation, exception management, risk monitoring, and compliance review.

From a Product Development perspective, the validation also confirmed that the product scope defined during discovery and prioritization could be translated into a functioning MVP experience.

9. Product Manager Acceptance

Based on the completed functional validation and UAT, the PayFlow Control MVP is considered:

Accepted for portfolio MVP demonstration and product case-study presentation.

Further validation would be required before a production deployment, particularly around security, authentication, API integrations, production data infrastructure, scalability, monitoring, and regulatory requirements.

Document Status: Final

Validation Status: UAT Accepted

Product Stage: MVP Validation
